Recent reports have shown an alarming upwards trend in autoimmune disease diagnosis, including type 1 diabetes, celiac disease and lupus.The American Diabetes Association reported a 23 percent increase in type 1 diabetes over an eight-year research period that ended in 2009. Type 1 Diabetes is caused from genetics and environmental factors. With such a rapid rise in diabetes over such a short span of time, it is believed that environmental factors are the main contributors to the recent upward spike since genes do not change that quickly. The London Lupus Centre, Book of Lupus: A Patients' Guide Mar 13 2021 Lupus is an extremely common, potentially treatable, disease of the immune system. It affects approximately 1 in 1000 women and is more common than diseases such as multiple sclerosis and leukaemia. Despite this, there is little information concerning the disease in contrast to other illnesses of similar prevalence. Many people are unaware of the symptoms, treatment, and prevention of lupus. It is important that these topics are highlighted for many reasons. For example, a greater understanding of the symptoms of lupus will enable patients to recognise the symptoms earlier, and get treatment faster; before any serious damage is done. Similarly, awareness of preventative measures may reduce the number of cases of lupus that occur. From a different perspective, it would be of great use to have an easily accessible source of information available to lupus patients that would highlight issues such as treatment options and sources of support. In summary, although knowledge of lupus is growing, greater awareness of the disease amongst both patients and the general public is an issue that needs to be addressed.

Multiple sclerosis (MS) Nov 20 2021 Multiple sclerosis (MS) is an autoimmune disease of unknown aetiology that affects the white matter of the central nervous system (CNS). The symptoms of multiple sclerosis are diverse, depending on the location and size of the CNS inflammatory lesions (plaques). MS is divided into subtypes: relapsing-remitting, secondary progressive and primary progressive. The relapsing-remitting form is the most common. MS is diagnosed on the basis of clinical presentation, cerebrospinal fluid (CSF) examination and magnetic resonance imaging (MRI). Pulse corticosteroid therapy is used to manage acute exacerbations. The first-line disease-modifying agents indicated for long-term therapy are interferon beta and glatiramer acetate. Natalizumab or fingolimod are used in particularly aggressive disease forms. No curative therapy exists as yet. Disease progress is individual. According to current estimations, MS decreases the patient's life expectancy by about 7 years.

Pathogenesis of Systemic Lupus Erythematosus Aug 18 2021 The scope of this contributed volume is to provide an overview of the latest translational research in the field of lupus pathogenesis, with particular emphasis on how these discoveries progress in parallel with therapeutic drug development. Systemic lupus erythematosus (SLE) is a multifaceted disease with a number of well-defined immune pathways that are dysregulated, resulting in an immune-mediated chronic inflammatory injury at target organs. As knowledge of these pathways evolves to provide opportunities for targeted drug therapy and lays the foundation for personalized medicine, clinicians and researchers need to keep up with the ever-expanding medical literature. This book will critically appraise the current understanding of important immunological pathways that contribute to the pathogenesis of lupus. We will review the role of interferons as part of the innate immune defects that perpetuate the loss of self-tolerance in SLE. B cell hyperactivity, as a defining hallmark of SLE, and different strategies of B cell targeted therapy will be discussed. The role of co-stimulation or immune checkpoint molecules in activating B and T cells will be reviewed, as well as other cytokines that serve in the amplification loop promoting a more proinflammatory Th1 or Th17 responses. Intracellular targets, such as signaling molecules in the JAK/STAT pathway, or a variety of kinases and proteasomes, can cause a cascading downstream effect of transcriptional responses that are important in SLE. Immune homeostasis can also be restored by bolstering the naturally occurring anti-inflammatory mechanisms. Glucocorticoid, as a potent natural anti-inflammatory hormone, can mediate its effects by recruiting histone deacetylase that serve to repress gene transcription. Glucocorticoid-induced leucine zipper is a gene upregulated by glucocorticoid that can be a potential target for development of anti-inflammatory strategy. Finally, T regulatory cells can be utilized to help restore to immune tolerance and are amongst the latest focus of therapeutic development in SLE.

Imaging Acute Neurologic Disease Jul 25 2019 "Acute neurologic diseases encompass a wide spectrum of medical illnesses with neurological manifestations which require rapid clinical, paraclinical and laboratory evaluation as patients are evaluated in the emergency department or acute care clinics. Everyday Miracles Aug 06 2020 A life-changing treatment is conquering auto-immune disorders—why doesn't anyone know about it? Thirty-five years ago, Dr. Richard Burt began a journey to treat chronic autoimmune diseases as they'd never been treated before. Using a treatment originally developed for leukemia but modified to be more gentle—a one-time combination of immune targeting drugs followed by a transplant of the patient's blood stem cells—he has documented the successful and often dramatic reversal of multiple sclerosis, systemic sclerosis (scleroderma), chronic inflammatory demyelinating polyradiculoneuropathy (CIPD), neuromyelitis optica, and Crohn's disease. After decades of study and randomized trials, his approach, which has been duplicated in other parts of the world, is finally being recognized as an effective means of reversing these “incurable” diseases. Some of his patients have been symptom-free for more than twenty years, and in this book Dr. Burt tells their stories alongside his own journey of developing and refining the treatment, known as hematopoietic stem cell transplant (HSCT) for autoimmune disorders. “These patients are the heroes,” Dr. Burt has said. “Their bodies and spirits faced unrelenting disease, and yet they fight valiantly against the suffering and obstacles.” What is HSCT? How does it work? What are the risks? Why aren't more doctors talking about it? And why is it still out of reach for so many patients who could benefit from it? Dr. Burt answers these questions and many more. Written for the layperson, Everyday Miracles grants patients with autoimmune diseases and the people who love them insights into the revolutionary approach that could convert their life sentence into a one-time reversible illness.

Demyelinating Disorders of the Central Nervous System in Childhood Sep 06 2020 Although multiple sclerosis and other disorders of myelin formation and repair are most commonly associated with adults, they can also occur in infants, children and adolescents. Up to 5 percent of those with MS experience symptoms before the age of 18, and the number of cases diagnosed is rising. There is a lack of awareness about these diseases in childhood, however, even amongst pediatric neurologists and MS specialists. Demyelinating Disorders of the Central Nervous System in Childhood provides comprehensive coverage of these diseases, highlighting throughout the differences between management in childhood and in adults. With sections dedicated to the diagnosis, course, treatment and biology of pediatric MS, detailed chapters on other childhood demyelinating diseases, including acute disseminated encephomyelitis, optic neuritis, acute complete transverse myelitis and neuromyelitis optica, are also provided. Essential reading for pediatric neurologists and MS specialists, this book will also be valuable reading for adult neurologists and pediatricians.

Autoimmune May 15 2021

Healing Autoimmune Disease Oct 08 2020 Autoimmune disease affects approximately one in 20 people and is one of the most significant health problems in the USA. There are more than 80 different autoimmune diseases, ranging from skin conditions such as psoriasis, to potentially life threatening diseases such as lupus, Crohn's disease and multiple sclerosis. An autoimmune disease occurs when a person's immune system launches an attack against their own cells, tissues and/or organs. This results in inflammation throughout the body, and potential damage to specific organs. Conventional medicine states that there is no cure for autoimmune disease, and the patient is usually placed on a cocktail of powerful immune suppressing drugs. Although in the short term these drugs can be life saving, in the long term they have significant side effects that are sometimes worse than the original disease, and they can even increase the risk of cancer. In this book, Dr Sandra Cabot and naturopath Margaret Jasinska give the reader a step by step plan for healing autoimmune disease, reducing inflammation, alleviating symptoms and halting autoantibody production, thereby stopping tissue destruction. This book offers a medically proven approach to assisting immune system disorders. In this book, the reader will learn: * The role of specific foods and supplements in reducing inflammation and healing the immune system. * The detrimental effects of gluten on the immune system, inflammation and intestinal health of people with autoimmune disease. * How common nutritional deficiencies can raise the risk of developing an autoimmune disease. * How leaky gut syndrome is a factor in triggering autoimmune disease. * The role of hormones in influencing autoimmune disease. * How vaccinations and environmental chemicals can trigger autoimmune disease in some people. * Which specific foods to avoid and which foods to eat more of. * Recipes for healing autoimmune disease
